
The Futures Triangle (未来三角)

"The first Design Futures tool I'm using is called the Futures Triangle. It's developed by futures scholar Sohail Inayatullah, and it asks a deceptively simple question: what forces are shaping this particular future?"

我正在使用的第一个设计未来工具叫做未来三角。它由未来学者苏海尔·伊纳亚图拉开发，它提出了一个看似简单实则不然的问题：是什么力量塑造了这个特定的未来？

"You have three forces in tension."

你有三个力处于拉伸状态。

"The Pull at the top is the vision — the future we want to move toward. For this project, that's a world where eating well feels as meaningful and rewarding as completing a run. Not because we've added more data, but because design has made the invisible biology of good nutrition finally legible. The emerging technology is already signalling this: continuous glucose monitors that were medical devices two years ago are now consumer products. The market grew to $370 million last year and is growing at 17% annually. Non-diabetic users — people choosing this for wellness — are already the largest segment at 41%."

顶层的牵引力是愿景——我们想要迈向的未来。对于这个项目而言，那是一个吃得好与跑完一次长跑同样有意义、有回报的世界。这并非因为我们增加了更多数据，而是因为设计让良好营养的无形生物学原理终于变得清晰易懂。新兴技术已经在发出这样的信号：两年前还是医疗设备的连续血糖监测仪，如今已成为消费产品。该市场去年增长到3.7亿美元，并且每年以17%的速度增长。非糖尿病用户——为了健康而选择使用的人群——已经是最大的细分市场，占比41%。

"The Push at the bottom-left is what's already happening, right now, that's moving us in that direction: sensor technology maturing, the anti-diet movement growing, public health systems under pressure to find preventive solutions rather than reactive treatment."

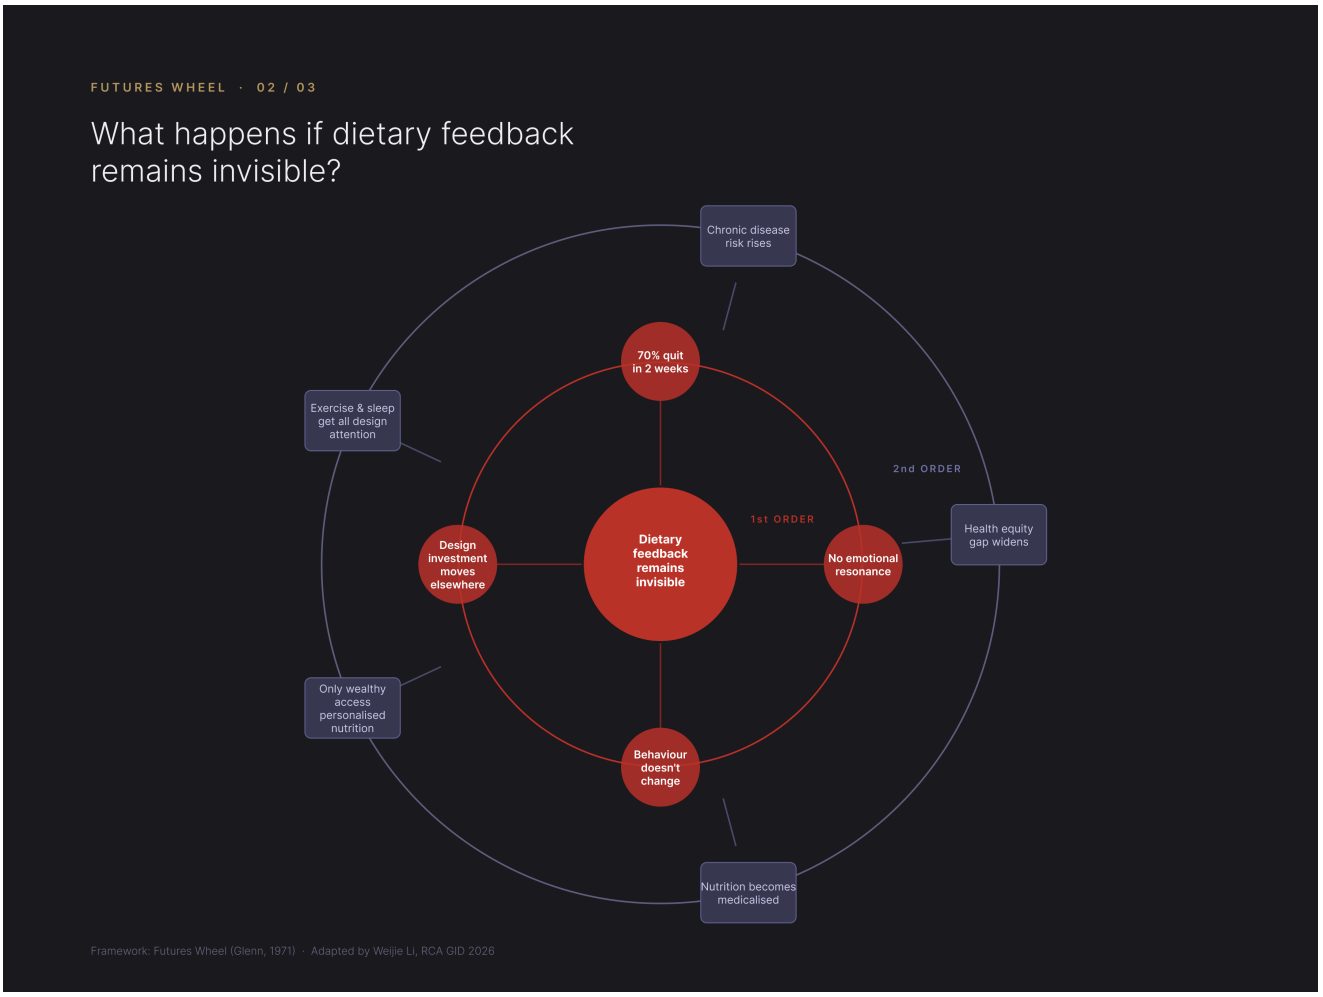
左下角的推动力是目前正在发生的事情，它正推动我们朝着那个方向前进：传感器技术日益成熟，反节食运动不断发展，公共卫生系统面临着寻找预防性解决方案而非被动治疗的压力。

"And the Weight at the bottom-right is what's holding us back. This is where my project is different from most health tech work. I'm not pretending the Weight doesn't exist. The biggest weight is the eating disorder risk: intensive dietary self-monitoring is clinically associated with elevated disordered eating risk in a significant sub-population. That constraint is non-negotiable for my design."

右下角的“负担”才是阻碍我们的因素。这就是我的项目与大多数健康科技工作的不同之处。我不会假装“负担”不存在。最大的“负担”是饮食失调风险：在相当一部分人群中，严格的饮食自我监测在临床上与饮食失调风险增加有关。这一限制在我的设计中是不可协商的。

"My project sits in the tension between these three forces. The design challenge is to strengthen the Pull, leverage the Push, and — crucially — design explicitly around the Weight."

我的项目处于这三种力量的张力之中。设计的挑战在于强化拉力，利用推力，并且——至关重要的是——围绕重量进行明确的设计。



The Futures Wheel (未来之轮)

"The second tool is the Futures Wheel. It's an analytical tool that maps consequence chains — what happens if the current situation continues unchanged?"

第二个工具是未来之轮。它是一种分析工具，用于描绘后果链——如果当前状况持续不变会发生什么？

"I put at the center: dietary feedback remains invisible. That's the status quo. Now I trace the consequences outward."

我把核心问题归结为：饮食反馈仍然不为人知。这就是现状。现在我来探究其向外延伸的后果。

"First order: 70% of dietary tracking app users abandon within two weeks. There's no emotional resonance. Behaviour doesn't change. And because users abandon, product investment moves elsewhere — to exercise, to sleep, to areas with better retention metrics."

第一个问题：70%的饮食追踪应用用户会在两周内放弃使用。缺乏情感共鸣，行为没有改变。而且由于用户流失，产品投资转向其他领域——运动、睡眠以及留存指标更好的领域。

"Second order: Chronic disease risk continues rising because the one behaviour most strongly linked to long-term health — dietary choice — is the one that design has most completely failed. The gap between exercise tracking sophistication and nutrition tracking

sophistication widens further. And personalised nutrition becomes something only people who can afford clinics and personal dietitians can access."

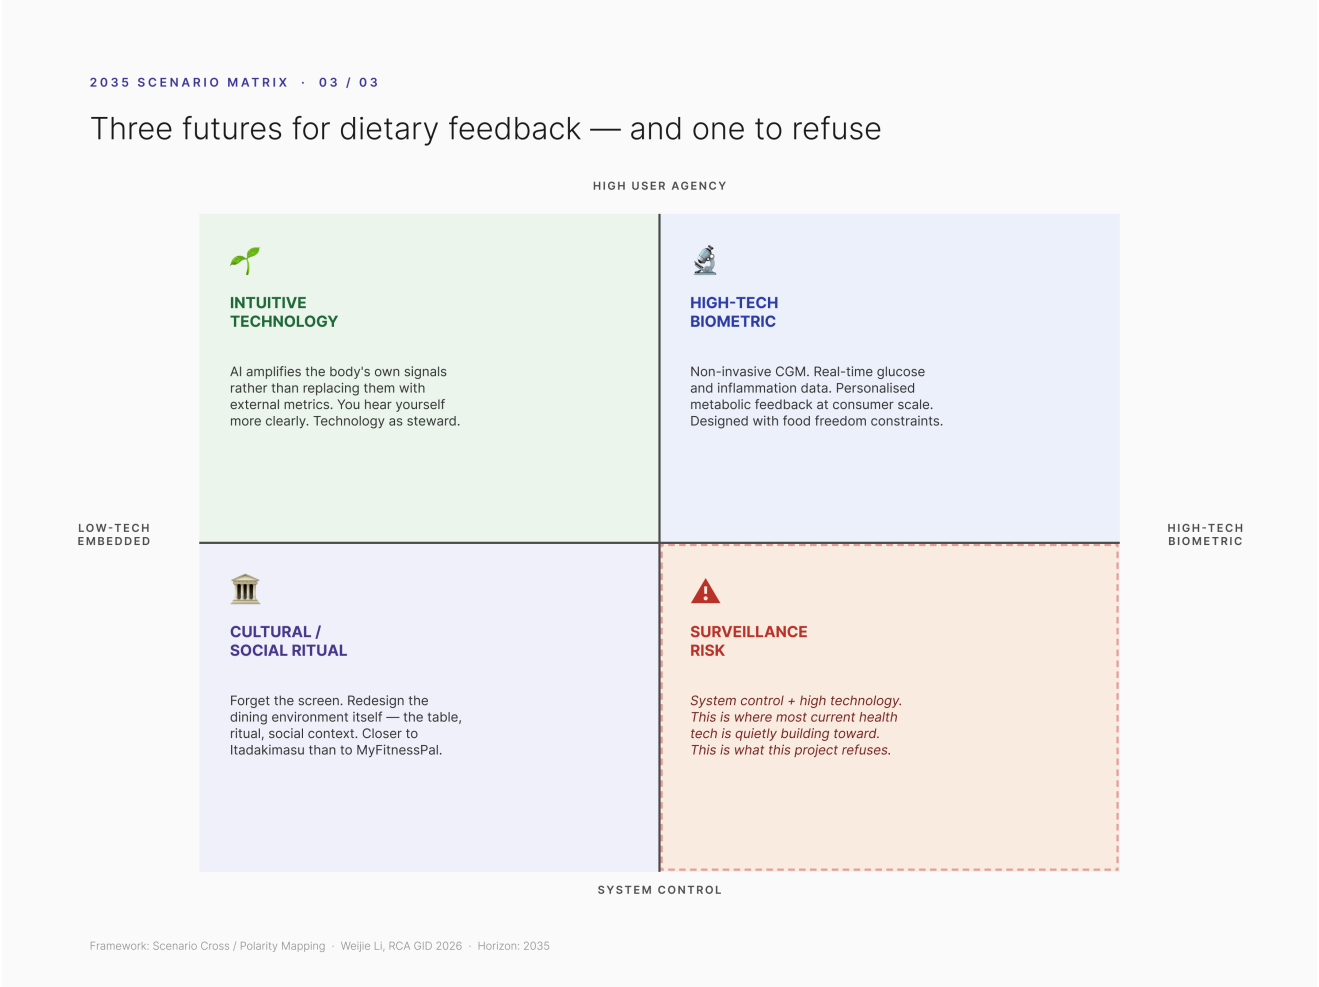
二阶问题：慢性病风险持续上升，因为与长期健康关联最为紧密的行为——饮食选择——恰恰是设计最彻底失败的领域。运动追踪的精细程度与营养追踪的精细程度之间的差距进一步拉大。而个性化营养成为只有负担得起诊所和私人营养师服务的人才能享有的东西。

"The Futures Wheel isn't about being pessimistic. It's about making the cost of inaction visible. If nothing changes, the consequence isn't just 'people eat slightly worse.' The consequence is a widening health equity gap, a medicalisation of what should be a universal daily experience, and a design field that declared nutrition too hard and moved on."

未来之轮并非是悲观的体现。它旨在让不作为的代价变得显而易见。如果一切照旧，后果可不只是“人们的饮食稍有变差”。后果是健康公平差距不断扩大，本应是普遍日常体验的事物被医疗化，以及设计领域宣称营养问题太难而选择放弃。

"My project is a response to that wheel. It asks: what if we interrupt it?"

我的项目是对那个轮子的回应。它提出了一个问题：如果我们打断它会怎样？



Polarity Mapping (极性映射)

"The third tool is the Polarity Mapping — this is where I generate my three 2035 scenarios."

第三个工具是极性映射——这是我生成三个2035情景的地方。

"I chose two axes. The horizontal axis runs from low-tech embedded environments — think cultural rituals, social dining — to high-tech biometric tracking — continuous metabolic monitoring. The vertical axis runs from high user agency — the user chooses what to engage with — down to system control — the system decides and delivers."

我选择了两个坐标轴。水平轴从低技术嵌入式环境（想想文化仪式、社交聚餐）延伸到高技术生物特征追踪（持续代谢监测）。垂直轴从高用户自主性（用户选择参与的内容）向下延伸到系统控制（系统决定并执行）。

"This creates four quadrants. Three of them become my scenarios. The top-right is the High-Tech Biometric scenario: non-invasive continuous metabolic monitoring, real-time glucose and inflammation data, personalised to you. Powerful, but needs to be designed with the eating disorder constraint front and centre."

这就形成了四个象限。其中三个象限成为了我的情景设定。右上角是高科技生物识别情景：非侵入式连续代谢监测、实时血糖和炎症数据，且为你量身定制。功能强大，但在设计时必须将饮食失调限制置于首要和核心位置。

"The bottom-left is the Cultural and Social Ritual scenario: forget the screen. Design the dining environment itself — the table, the ritual, the social context — so that eating well becomes a shared, celebrated act. Closer to Itadakimasu than to MyFitnessPal."

左下角是文化与社交仪式场景：忘掉屏幕。设计用餐环境本身——餐桌、仪式、社交情境——让好好吃饭成为一种共享、值得庆祝的行为。更接近“いただきます”（我要开动了），而非“我的健身伙伴”（MyFitnessPal）。

"The top-left is the Intuitive Technology scenario: AI that works to amplify your body's own signals rather than replacing them with external metrics. The technology helps you hear yourself more clearly. That's the compass-based design principle in action."

左上角是直观技术场景：AI致力于增强你身体自身的信号，而不是用外部指标取代它们。这项技术能帮助你更清晰地感知自身。这就是基于指南针的设计原则在发挥作用。

"The bottom-right quadrant — system control plus high technology — is the warning case. That's the surveillance future. That's what most current health tech is quietly building toward. That's what this project explicitly refuses."

右下角象限——系统控制加上高科技——是警示案例。那是监控的未来。那是当前大多数健康科技正在悄然构建的方向。而这正是本项目明确拒绝的。

TUTOR FEEDBACK · APRIL 8, 2026 · 3 NEW FRAMEWORKS

"These three ideas reframe everything about how this project should work."

01

COMPASSION-BASED DESIGN

The question isn't 'how do we make people eat better?' It's 'how do we help people feel better about eating?' The designer shifts from optimiser to steward — genuinely caring for the user, not judging them.

→ From optimiser → to steward

02

EMBODIMENT + EMPOWERMENT

How does a design intervention connect people more deeply with their own bodies — not as objects to be tracked, but as subjects to be understood? The key word is choice, not compulsion. The system offers; you decide.

→ Body as subject, not object

03

OBSERVER PERSPECTIVE

Rather than judging whether a meal was good or bad — you notice what you actually felt. Not 'this was terrible' but 'seven-degree water is moving across my body.' Applied to eating: curiosity, not evaluation.

→ Curiosity, not evaluation

"Put these three together: build something that makes eating feel meaningful — not by adding surveillance — but by helping people notice what is already there."
