说话人 1 00:00

so and in this term you' re gonna be executing your ideas right so when you' re executing there will be number of tasks that you' re gonna be doing so when you engage with those tasks you' re gonna be generating insights you' re gonna be generating understanding it can be technical, understanding research, understanding embodied knowledge i' ll talk about what embodied knowledge means in my next slide you' re gonna be you know you' re gonna be think you' re gonna be generating。 Hasic understanding, I'll be talking about what that means in the next slide. So there will be quite a lot of insight that you put together. So what we want you to do is we want you to make that visible to us when we go and check your birth. So this session is all about supporting you to understand how to make that visible, what strategies and what approaches that you need to adapt in a much more simple way, what strategies and approaches that we can adopt to make that visible. So the last intention, understand and apply systematic methods for documenting and communicating design research knowledge, which means that in this session, I'll give you like two examples or two. strategies or two approaches that you can apply to your work so that you could like build up a solid research log or solid research evidence in that you have been collecting all this passive material and body knowledge throughout your journey OK right why this matters now of course in your learning outcomes there are five learning outcomes and when you try to achieve these learning outcomes as i highlighted earlier you will be generating this。 you will be generating different types of knowledge and if you look at the unique timetables as we discussed yesterday at the end of each week, we indicated that document evidence of method testing validation of research ideas project concept refinement of audience stakeholder identification acquisition of appropriate technical design skills。 We just indicated some of these things, and we highlighted that we would like to see evidence. Yeah, so

as I said again, this session is about that. So this session covers you. What do we mean by research love and how to showcase. And then if you look at the other.

说话人 1 02:30

Evaluation report section 90 you have been asked to write a reflective evaluation right now in the report template, we have given you some prompts to follow, but in a nutshell when you start writing this 52000 word reflection you will have to refer to your journal or you will have to refer to your research evidence right by referring to. That is where you're gonna be providing this reflecting, right? So assessment again, this session is all about giving you support or giving you some inspiration to put together some of these evidences in the form of a research law. And then hopefully that will help you to go and write your reflection. Yeah, so that's why this sessions mean, you know, be reverse to you.

说话人 1 03:27

Now to start the source, it would be lovely to do a quick activity just to understand what sort of knowledge that you have with regards to your gate labor. So the quick activity is I want it like you. any piece of paper or maybe your laptop your computer whatever write one thing that generally consider yourself good at what are you good at just one thing it can be a sport, it can be a task or it can be a subject it can be a practice whatever that you are really good at two minutes think something that you are really good you don't even need two minutes one minute yeah something that you are really good at. don't say research okay something that you are really good at it can be a craft it can be a sport it can be you know cooking dancing I don't know it can be drawing, it can be photography, it can be eating sleeping. we have some masters for sleeping here. yes, done isn't it that much fun now I want you to write down so think about what you are really good at now I want you to write down three reasons for qualities that makes you expert at it so in other words how do you know that you are really good at it what sort of evidence what sort of things or what sort of reasons qualities that you have within you to make you good at it. or in other words how do we know that you're really good at three things only three things there no more than that I'll give you just two minutes.

说话人 1 05:47

I will ask you that so something that you're really good at and then how do we know that you're good at.

说话人 1 06:17

yeah, OK right I'm gonna ask a couple of you to share what are you good at and what are the three qualities or three reasons or three evidences that you see within you saying that you are really good at. anybody to share alright nobody share OK now you what are you really good at.

说话人 2 06:50

OK, so right now is community。

说话人 1 06:54

community is it community working。

说话人 2 06:58

yeah, it' s community with someone to add them to target someone or to just help to find what they need。

说话人 1 07:07

yes, it is like a lot, but i just need one。 community。 community working。 how do you know that you' re really good at it。

说话人 2 07:15

Yeah, cuz I can have more information, right?

说话人 1 07:21

I'm doing free quality, not really useful.

说话人 1 07:30

Second one, making, yes, think about it. Okay, so like, CJ, do you like to share?

说话人 3 07:58

Okay, I think one thing that I'm good at is like hand lettering, like illustrating letters. Yeah, I only have two reasons. I can't think of the third one. So for my first reason, I've been doing it consistently since I was young. So long term effort. And I guess the second one is the output. I think when I illustrate like the letters, they look like they're printed.

说话人 1 08:26

So cool. Yeah, so it's basically long term effort. And the second day, if the output, like the aesthetics were pleasing. So those are the qualities or the, you know, or the evidence or the reasons that you think that you are really good at it. Cool. Thank you. Who else? Michael?

说话人 2 08:46

Oh, I'm good at self loving.

说话人 1 08:50

Yes. Okay. So the evidence is I having confidence.

说话人 2 08:54

And then no matter like I know I'm a little ubby than other girls in China, but I won't feel I'm awkward or I know who are not pretty enough.

说话人 1 09:03

And then I'm like, I have been told by my friend that I come. That's why. Bye bye. Cool self love. Who else? Okay, now I wanted like think a bit more closer. Yeah, now are those three qualities act? actually what makes you good at it are the just the easiest three things to say right or communicate so what I'm asking is so you've been just you're just you share three things with me right but do you think that those are the three qualities or three evidences that makes you really good at it is there anything else that you can't really communicate for example I'll take CJ's example right so CJ is good at doodling I'll just say doodling yeah you know doodling right so the reasons are. obviously long term practice and the outcome, but now we can easily communicate those evidences reasons, but what about our senses what about like you know the way you are doing the doodling the material engagement, the smell, the touch right or maybe like you mentioned that people like it though the aesthetics were pleasing, but in what way yeah so some of these things like some of the qualities, some of the insights, some of the evidences we really can't. Communicate. Does that make sense?

说话人 1 10:45

So when it come to even research, that's what most of the time happens, especially in design research, right? So when you are engaging with practice, when you are designing some. when you are even conducting employing research methods there are certain things that you can verbalize that you can express using textual visual medium, but there are certain decisions there are certain insight there are certain notions that you take intuitively in other words you just take those decisions without really expressing we call them as tacit knowledge or implicit insight. now this implicit insight or tacit knowledge being developed throughout your career sometimes if you are an early career researcher you have a certain amount of I wouldn't say limited, but you have an extra amount of tacit understanding about your subject matter, but when you grow as a researcher when you grow as a designer when you engage with quite a lot of projects you build up that tacit understanding again coming back to CJ's example you started doodling for example let's say 5 years ago but if you do it. another 10 years you become much more aware about your capabilities you understand the fineness of the doodling you understand the limitation of your paper limitation of the ink you understand how long it might take to produce an A3 size doodle etc so all of these things come from your practice and sometimes those cannot be verbalized express we call it tacit knowledge and it's pretty important that as design researchers one of our tasks or one of our skill is to. evidence is yeah now this session and the expectation of asking you to maintain a research log is to evidence your tacit understanding that you are building up throughout this unit or throughout your career in that field does that make sense yeah right. Now I would go into theory because it's

not the time and it's not necessary, I guess. But when you ask what type of knowledge that we can develop, generate in design research, there are number of knowledge branches, right? For example, you have anybody. knowledge if you look at a dancer right their knowledge being embodied into their movement。 Expressions, right? And sometimes, as I highlighted, with tacit knowledge, they cannot be read.

说话人 1 13:43

clearly express verbal and then if you do well reflective knowledge now。 Knowledge that surfaces through reflection on action, which means that sometimes the knowledge or the insight or the understanding happens.

说话人 1 13:59

1 you once you complete an activity and then once you look at that again, late, like sometimes if you look at a model like action research, right, critical reflective practice, what you do is you engage on an action and then you look at it, you think back. And that thinking allows you to understand what happened, why that happened, what needs to be done to improve it. So when you thinking about that, it build up understanding, it build up non. right, so we call that reflective knowledge and then of course the stuff that you do at the moment like you are engaging with different research methods some of you are doing prototyping some of you are doing case studies some of you are doing experimental design research and the knowledge that you will develop from that they can be generalized what i mean by generalizing is that you can publish that knowledge so that other people can apply the same method, same procedures。 reach the similar level of insight or similar level of outcome yeah, so that is transferable knowledge and then finally designer knowledge which is embedded into the objects that you design or objects that you create so as i said that there are different types of knowledge, branches and more or less as a design futurist when you engage with your IRC or when you engage with your future design project。 You without knowing or without probably you know some of these things, but sometime without knowing you are generating engaging with either one, two or three of these knowledge branches Yeah Now let' s look at why and how does it relate Now when we move into the next week or maybe this week。 you have been asked to test, I mean even yesterday' s lecture was all about interviews you know were talking about how to test your interview transcripts how to test your you know the recruitment strategy。 now going into the next couple of weeks you will be engaging quite a number of research methods now from you know from your proposals we manage to extract some of these methods。 diary based prototyping expert interviews co- design workshop participant observation。 Role play complex system mapping focus group observation etc These are all of these are like some of them are futures methods some of them are qualitative methods that you can use to understand gain current understanding, But when you engage with these activities or when you plan these research methods there are a number of tasks that you need to do I' ve already mentioned one if you' re doing interviews you need to do what You need to recruit participants Yeah。 does that

make sense do you need to include participants。 you need to have your pilot questions you need to test the questions right。 if you' re doing focus group what you should be doing。

说话人 2 17:41

focus group anybody can talk about the focus group solution。

说话人 1 17:52

recording I mean you have to think about how you' re gonna record again question it you have to like define the type of questions that you' re gonna ask you need to first of all you need to have an focus like you know what is the focus of my focus group and then if you' re doing observations like will you be doing participatory observation or will you be you know will you be part of the setting and observing something or will you be out of the setting and observing how your participants are engaged so there are a number of tasks number of。 procedures that you need to follow when you do these sort of methods or when you' re thinking about testing these methods right now the other aspect that you' re gonna be doing in term two is making right or maybe you might be after you conduct your research or after you conduct employ your research methods you' re gonna be starting to make something or starting to produce your outputs now in those cases there are a number of things you' re gonna be doing now for example if some of you are thinking about。 creating a prototype then you need to think about material qualities where are you gonna buy the material who what is the material color? right if it is let' s say a fully functioning material what that function should look like and then if you some of you might thinking about drawing as a way of like thinking about your output if that' s the case drawing as a way of thinking about the composition。 color coordination some of you might do electronics so you know functional stuff so if that' s the case what sort of components that you need to be functioning what sort of electronic elements that you need to be engaging with who are you going to。 Approach to build up this component supplies experimental setting like in the next three weeks. So you probably have to think about if you are like, you know, engaging with these sort of experimental journey, what would be your experimental setting, lighting condition?

说话人 1 20:21

If you're thinking about, let's say if you wanna like keep sir, I mean, if you're going to buy a material lab, what is the temperature, what. is the moisture level all of these things again the procedures the task the idea that you need to be aware of yeah now some of you are really digitally savvy so there will be people doing for you right so if you are thinking about making digital experiences or videos or whatever。 you will be starting doing that boarding or any other digital。 Experimentation.

说话人 1 21:01

So the whole, so why I wanted to like highlight all of these tasks is that this is what you need to be evidencing in your research journey. Again, coming back to my initial point, all of these

things, like so far what you have seen is like you have when when we when you are engaging with your research project, you are planning the activities in your mural or Figma mode.

说话人 1 21:30

And then you are executing without providing us the evidence of engagement of all of the tasks that I highlighted earlier Does that make sense For example again interviews In your Murabba board you indicate I will be conducting semi- structured interviews with five professionals You probably might do the interview questions in your Murabba or figma right, But for us that is not going to be enough to see your knowledge That' s not going to be enough for us to see。 progression so that' s why i highlighted like when you do interview you need to have transcript you need to test your questions you need to analyze by applying for example thematic analysis for you to do thematic analysis you need to do a bit of coding extract some themes out of your transcript etc so these are the tasks procedures that you need to follow those procedures task needs to be evident in your journal yeah。 going back to again like going back to this sort of thing right Biomaterial If you are at some point in your term three when you are ready to prototype you might go into biomaterial lab and you might start making something right so in that case we would like to see a recipe we would like to see your innovation we would like to see the mistakes that you have done we would like to see the you know the critical design decisions that you have taken to come out with a successful outcome。 so that' s what you have to do when you put together your dress right lock so do you have any questions after that does it make sense。 right how to put this together I' m gonna talk about two approaches or two strategies that you can simply apply。

说话人 1 23:39

I, in this term, right? We, I know we try this approach in Envisioning Futures. Some of the students like, you know, oh, actively engage with it and provide us some evidence. But now in your IRP unit, IRP real. realization we want everybody to engage with maintaining the research log and providing us this evidence OK how to do it there are a number of ways, but I just pick two simple strategies number one progressive overview map hands up if you have been doing progressive overview map already now progressive overview map pretty simple right so all you have to do is to map your approach。 I' m gonna read what you see in the screen it' s a summary of your research journal depending on what you are doing in a weekly basis or fortnightly basis。 what do you need to do? it' s like you know the maps can be short written statement or diagrammatic sketches at specific stages of your project you can generate progressive overview map can be sketched on paper or created as digital files but each map must be clearly dated and。 Historical archive in the form How to do it Pretty simple All you have to do is ask three simple questions from you just need to ask yourself I am exploring the specific question phenomenon research method or design technique So in other words when you start mapping something when you start mapping your research journey first write down what are you exploring Is it about a specific question Now in this week what are you exploring。 or if you are

planning to let's say next week if you are going to think about future personas as a method right at the end of that week you could build up a quick, but insightful. Progressive research back by answering three simple questions. But you just ask yourself, oh, you just write down and exploring future personas, right? And then by doing. but how are you exploring that now certain people certain students they take different approaches to explore future persona or apply future persona so what we are expecting you to do is like while you are doing that research bit while you are doing future personas we expect you to have a some sort of record of that approach by answering how you do that what are the steps or actions that you have taken to employ your future persona. and then in order to understand what are you trying to understand by employing that you could like ask you know prompts like what will people experience or learn what is the relevance of this future persona for my project how does it relate to a problem or phenomenon in the design practice, design theory or the world like you could ask like OK I'm doing future personas and I'm. Employing this x y set strategy and I'm doing this because I need to understand this aspect of my project or I need to build up a body of knowledge that will enable me to contextualize my scenario So what you are doing is at the end of that week or at the end of that activity you are answering simple questions. Supported with some viscous or textual evidence to build up a map. Yeah, and that is part of your research log. And you can bring that research log or research log entry to the tutorial so that we have evidence of.

说话人 1 28:00

engagement to start a discussion about OK how do you have engage with future persona? what are the evidence that you have how what are the type of personas that you have generated etc does that make sense.

说话人 1 28:45

And the other thing is like when you are doing this mapping, like progressive mapping, it's pretty important that it should be just like story. It should be just. actual story it should be supported with some form of literature or some form of evidence right so that is where I initially mentioned when you do your progressive mapping bring your sketches in bring your let's say if it is future personas bring your transcripts in bring your initial questions into your story or into your writing so that it becomes an insightful map for us to see. And also, it becomes an insightful map for you to share when you. Compile your portfolio at the end of your IAP.

说话人 1 29:44

the other strategy. You or the other approach that you guys can apply is a reflective research law. Now this is again, pretty simple. Probably you have been doing this in your. or BA right especially if you're coming from a making background what you're supposed to be doing is you engage with your research you engage with a particular task or forophilia or making activity and then again you ask three simple questions so you go through three simple reflective stages and

document what that comes to you for example。 before the activity, so you can have a diary or you could have a sketchbook you could have a simple revamp the file。

说话人 1 31:04

Yeah, you could have hundred and some to. When it's come to a research law, you could, I mean, a reflective research law, you could have a reminder if you wanna have a physical. So you could easily have a digital file.

说话人 1 31:21

It's not a hard rule, but the most important thing that you need to consider is how you gonna be engaging with. And I've just put together some simple questions for you to think it through. For example, before you engage with an activity, going to engage with the, you know, a making activity or a research activity, what you could do is you could ask, you know, could write down what are the aims or what are the experimental scope that you are, you know, that you are considering, what is the context behind it. And during the activity, it's pretty important that you think about the processes, methods and the steps that you are taking through. And this needs to be supported with some images. So this needs to be supported with some diagrams. Or sometimes if you are doing it digitally, you could have some video matching. serious yeah and the other thing is after the activity this is what your reflective research log becomes insightful after the activity you just need to think about the positives negatives and more importantly reflection for action based on the reflections on action what might be done differently when you are。 doing this activity next time or what sort of changes that you might like to do if you are trying this again in the next week。 So in that way, what you are developing is. So in that way, what you are documenting is you are documenting a living theory. You are documenting your. what you do as a researcher and also by asking these simple questions at three stages of your journey you are building up a body of knowledge that is personal to you and also showcasing how you have progress with this journey。 again couple of examples from previously completed journals or reflective journals these are manual, but if you like as I said。 I don' t have a detail example to show you because we haven' t really seen any excellent reflective research logs yet from design futures so this is something that we would really like to push and see how students will take this on。 But there are a number of very interesting physical entries that we can, you know, that we have seen over the couple of years, but it wasn't consistent. So we want this here, especially with you all. We would like you to like take this as a key deliverable and clearly document the journey by employee.

说话人 1 34:24

One or two of the strategies that we have share now. I would I' ll also like to share this one because this is what I am doing as a practitioner for me to communicate the explicit knowledge or for me to communicate the implicit knowledge to my audiences I mean it' s slightly I would say it' s slightly complicated, but just to make it simple for you now in my practice, I am

employing action research which is more about action reflection. and also I'm employing what so what now what for reflection I think you have already heard this while you are doing a cross- case. yeah, some people have seen a cross- case and I think that's part of your cross- case. we were talking about a critical reflection model, but for your reference I'll very briefly explain what I do to make my tacit knowledge or embodied knowledge visible to others so basically when I engage with my work. of course I plan my practice or I plan my project I engage with literature review focus group research, interview survey research all of these things they are the backbone of my plan right and all of the insight that goes into my journal again I do the focus group I reflect on some of the key procedures that I employ that goes into my journal and then once I do my plan and I engage with my practice which is tech it can be electronic. as it can be printed textiles natural dye it can be bio material design so that's my practice so while I'm engaging with my practice I have my data capturing strategies in place in other words I photograph I video document I take notes I capture experimental data in a very strategic way or I collaborate with other scientists to come in and capture data on behalf of me I use quantitative tools and equipment to get. quantitative data so all of these things being documented through. Two different ways. And some of the inside, some of the, let's say some of the task, some of the issues that I face goes into my chair. And then it comes to the reflection stage of this action reflection cycle where I think about the material engagement, the. design decisions the experimental procedures and the type of intuitive judgment have taken now that bit being reflected by considering the. Is what, so what now? What questions, right? So especially when I go into the reflection stage, I am like things. like what are the positives? what are the negatives how this experimental data relate to my research question what are the changes that might have to do when I moved into the next cycle who are the people that I need to talk to where I need to find those people all of these questions I ask for myself and then those both into my journal right, so in three critical junctions of my approach to research approach to design practice I put entries to my journal yeah and that is the living theory of. Practice and that knowledge and that inside is verifiable. It's personal, but it's high, it's inside. And at that now that's how the knowledge being built up.

说话人 1 38:30

And again, for me, I'm in general physical now supported with video increase. But for you guys now you can decide what you want to do. You know, you could, some people might have YouTube. Hello Jenna from my to the platforms. Am I just use Figma or mirror, but in a strategic way? I mean, but the whole purpose is that don't just showcase what you do.

说话人 1 39:07

What we would like to see in your journalist, not just what we would like to see evidence of engagement in the context of analysis, in the context of sketches, in the context of material selection, in the context of, even if you are doing, as I said, interviews, transcript, how you have analyzed the transcript, what went wrong? what were the key insight that you have extracted

how you have extracted those insight we would like to see that clearly documented in your journal or in your digital journal OK so two strategies one you could employ a simple that simple what do you call it。 progressive overview map or else you can just use a log or a journal but it has to be critically reflective journal。 yeah any questions you have before。 So we jump into a quick activity. And then yes, we've already started a lot of work together to make this like one. It's not late. Thanks for asking. The eggs, it's. it's never too late yeah, because ideally speaking what I would like to encourage everybody to do is to maintain this form of critical thinking from the first unit itself because so far what we have seen in the IOP submissions is that you think about ideas you put together all the stuff in your initial you know Euro or figma or whatever and then you do the work but you are missing the code you are missing the evidence of engagement evidence of analysis。 you are not really showcasing or thinking through the middle you know the middle part of your journey so to answer your question it's never too late now you are executing your you know your plans right so when you are executing let's start a journal or it doesn't have to be a journal as i said it could be a progressive map it could be a series of sheets yeah or you know it could be something else but the whole point is that you are journaling。 with a strategy in play in mind for example if you look at progressive map there are three。 Series of questions that you are asking from you if you are thinking about reflective love, there are a series of questions that you are asking from yourself. That's the strategy, that's the mechanism. But if you can, in. ploy that mechanism every week。 weekly basis or maybe fortnightly。 and generate increase and rethink about your process and provide that evidence I think that's gonna give us a solid evidence of your progress。

说话人 1 42:22

Who's maintaining journals at the moment like research log。 Physical。 And have you been having a strategy like this like consistency within your。 Is it just about like, yeah, it's a mess. It's amazing.

说话人 2 42:40

For me, it's not about my process. It's a seller out like outward normally.

说话人 1 42:46

Okay, yeah, fine. But what you could do is like now embed your process into it.

说话人 2 42:52

Yeah, like, yeah, yeah.

说话人 1 42:54

But you mention is a mess. It's alright to have a mess. But now moving forward, maybe we could like think about these three core questions and then compile your love accordingly. Yeah, and again, it's not just writing. Yeah, you could just have posted notes. We are not talking about

writing when you are answering question. For example, when you go into this right before the activity, there are three questions, but you don't really have to write hundreds of ideas there. All you have to do is to put some. post it notes in your journal and then during the activity a couple of pictures like for example if it is future persona and you are testing out future persona take some pictures and then post it notes ask yourself what are the steps post it notes write the steps down quickly put it in your page and then after the activity some of the reflections can be put in post it notes and keep that on that page for the second page so it does not take that much of time to compile the evidence there. question.

说话人 2 44:16

what' s the format? Physical one.

说话人 1 44:20

Physical like physical means of control like a party.

说话人 2 44:27

Sometimes why read something and think that.

说话人 1 44:43

yeah, we just need to make sure that it' s not just about the note, it' s also about the work, the picture, the drawing, the internal generation, the transcript, the analysis that you do all of these things can go into that right, not just that ask those simple questions from before the activity during the activity after the activity whatever that you think can write it down on a post it' s perfect right, we' re not really asking you to follow any specific line. first of all in your journal or in your post product space build it up like throughout this 12 week you could do like every week like maybe think about the whole activity that you' ve done and generate the entry this can be intensive when you start making something like depending on your IRA because you might be doing i don' t know the outcome that you' re gonna be doing so when you go to that stage this entry can be like you know can be like if you' re doing two per week. maybe it would be like 3-4 because we' re engaging material. who else is doing so we have three journals at the moment. good. i need a special. systematic.

说话人 1 46:39

Good, good, so that' s OK, that' s part of extracting knowledge from secondary. OK, what about the stuff. That you need, like for example, the post, the banner that you design, right? So you test that opposition, you test the color to you test out your spots are they are the truth. So you have been like stretching that goes well. Okay, okay, okay, okay. And I think. in addition to that one of the things that we could do is after you complete that activity reflection like what are the feelings right what are the changes that you might to move forward let' s build that living

theory of practice belongs to you yeah and that's the most important thing that you would like to read when you see your not engagement. yes.

说话人 1 48:31

anybody else is doing.

说话人 1 48:41

谁还。

说话人 2 48:43

没有人。任何人。

说话人 1 48:48

没有。我觉得 as i say it's important that you have it's important that you start the process now because we would like to integrate one of you.

说话人 1 49:06

having some control over a lot maintain your business. yeah, right so let's do a quick. won't be. yeah, so let's do that. just to you know, just to get you into this mood. right. digital or physical just take a look. Pen and paper or if you have a laptop, you could work on the laptop, choose one experiment or think about making session or any research activity you have conducted for your IRP project. So probably for your proposal, you, I don't know whether you might have done any sort of pirating for your methods or if you have met somebody to verify your research ideas or maybe think about a unit, experimental unit that you have finished. the internal truth envisioning futures or an elective whatever that comes to your mind yeah this has to be something you have actually done not. Something you are planning, it does not have to be reserved. It can be, you know, something that has happened last year. I want you to answer 3 questions.

说话人 1 50:18

Like, what did this experiment aim to find out his domain? Like, think about that moment. Think about that you need or think about the output that you have created. Write down just one sentence what this experiment aimed to find out Second why and why why this and why now What led you to do it A material a reading or a conversation sort of previous failure Now it's just about why you wanted to do that at that point why you wanted to create that particular piece so why you wanted to test that method with that particular audience What was the main reason. who or what informed your approach like has it been influenced or inspired by literature or has somebody told you to do that so like just three simple questions write down one sentence each so first take a piece of paper take your laptop on and think about an activity or a moment or an experiment or an output that you have generated over the last. couple of weeks to last month

write down the question write down the answer in one sentence can you do that。 you have 5 minutes。

说话人 2 53:06

First. He doesn't help you.

说话人 1 53:25

我会做研究。

说话人 3 53:41

我会做研究。

说话人 2 54:30

Before some future design decision. For us to understand how far I'm going to make deflection energy. That's a wedding, like a wedding. So like.

说话人 1 55:31

I think, let's say.

说话人 2 56:00

So you'll have to answer. Second question, which is about what are the problem like that is to say sexualized English.

说话人 1 56:40

Yeah, finish yourself and clean and melon and ruin the skin that becomes you are doing like interesting.

说话人 2 57:12

Yeah, that's right.

说话人 1 57:35

Now to justify that, I am going to respect you also financial online.

说话人 2 57:51

Yeah, it is a real subject.

说话人 1 57:52

It's always good that we do some things to evaluate by the by different way now, oh, before we activate. So you evaluate and figure out what are the potential and that we can go to another moment and they will recopy.

说话人 2 58:12

I have three approaches on the door because stretch and then after the player. Yes, yes, like your junction. American children.

说话人 2 59:49

上次去马耳他不下雨，但是阴天。

说话人 2 01:02:49

You' re allowed。

说话人 1 01:02:59

No。

说话人 1 01:03:15

OK, you' re allowed。

说话人 2 01:03:23

Works。 It seems like a shirt. I'm here waiting to see somebody.

说话人 2 01:05:23

I know, I already know like. Particular way. That you have. Couple of docs.

说话人 2 01:06:52

And then, yeah, I'm sorry.

说话人 1 01:07:08

And I have to try beyond this.

说话人 2 01:07:09

Okay, this is the way of construction project.

说话人 2 01:07:38

The second day, a local problem.

说话人 1 01:08:36

I'm glad to you.

说话人 1 01:08:51

I mean, like this place.
