

Interview Topic Guide Project:

Why Eating Well Feels Like Nothing **Estimated Duration:** 45 - 60 minutes

Part 1: Warm-up & Past Experience

- Can you recall what initially prompted you to start using dietary tracking tools (e.g., MyFitnessPal, Noom)?
- How did it feel to manually log your food after every meal in your daily life? What aspects caused friction, or what eventually led you to stop using them?

Part 2: The Feedback Gap & Body Attunement

- When you eat a nutritious, satisfying meal, how does your body typically feel in the hours that follow?
- Did you feel that the "feedback" from those tracking apps (like scores or calorie bars) aligned with your body's actual physical sensations? How did they differ?
- Compared to the immediate physical feedback of a workout (like sweating) or a good night's sleep, do you find the feedback for "eating well" to be less obvious? How do you usually gauge if you've "eaten well"?

Part 3: Affective Tone & Food Freedom

- When looking at the feedback data in these apps, what was your typical emotional response? (Did you feel supported and understood, or did you feel pressured, judged, or guilty?)
- Did these tools change the way you view food or diminish your joy of eating?
- What does "Food Freedom" or "intuitive eating" mean to you personally?

Part 4: Speculative Future (Design Probes)

- Imagine a future tool that doesn't require manual logging or give you a numerical score, but instead gently helps you tune into your body's state (e.g., energy levels, digestive comfort). What would you want that interaction to look or feel like?
- In an ideal dining environment (like your home kitchen or dining table), what kind of design or setup would help you naturally make comfortable dietary choices without feeling any pressure?
