

CRIT 1 - SESSION FORMAT (Please do not include this slide in your final presentation)

Total slot: 15 minutes per student

Presentation: 5 minutes. Student presents using slides, referring to physical evidence on the tabletop

Discussion: 10 minutes. Staff ask questions and complete an assessment rubric.

Slides should contain minimal text and are used as prompts only, not scripts, students are expected to talk around each slide rather than read from it. For Slide 3, there is no slide content required; students present directly from the evidence on the tabletop

What needs to be on the tabletop? Students are required to display the following items on the tabletop:

1. A 3D object: a metaphor for the research project: Students may bring the same object they used at the IRP Proposal Crit, or an improved version. This is not a model or prototype. It is a thinking tool, a way into the research for an unfamiliar audience, used directly in Slide 1.
2. Visual evidence of primary research conducted to date: Tutors want to see what students have actually done, who they spoke to, what they observed, and what they found. This evidence is referred to directly during Slide 3 and should be visible and accessible throughout the discussion.

Peer evaluation: During the crit session, students will be paired up to conduct a peer evaluation. The details will be shared via Moodle

SLIDE 1 - INTRODUCTION TO THE PROJECT

Use the 3D object on the tabletop to introduce the project and research question to the audience.

Main research question:
XXX?

SLIDE 2 - DIAGRAMMATIC REPRESENTATION OF METHODOLOGY

Present a simple diagram showing a step-by-step overview of the project's methodological approach.

SLIDE 3 - METHODS AND INITIAL DATA COLLECTED (*No slide content required)

Students refer directly to the physical evidence on the tabletop to explain what they have done and what they have found.

How might you present your primary evidence on the tabletop?

Based on the type of primary research conducted to date, you may present your primary evidence using one or more of the following approaches. These are not polished outputs; they are just practical ways to organise and show raw research materials.

- **A simple booklet**
Print key research materials/details of the most important research activities (transcripts, questionnaires, observation notes, photographs, sketches, etc.) and staple them together. This could also be your reflective research log or folder. It should be easy to flick through during the session.
- **A printed sheet(s)**
Lay out images, quotes, or key findings on a single A3 sheet(s). This does not need to be designed; it can be printed and roughly arranged.
- **A set of cards**
Write or print one key finding, quote, or participant insight per card. Spread them on the table so they can be picked up and discussed individually.
- **A short video**
A simple compilation of footage from field visits, observations, or research activities, playing on your laptop. No editing is expected; raw footage is fine.
- **Printed photographs**
A small selection of photographs from your fieldwork, printed and brought to the table. You can add brief handwritten notes if helpful.
- Or any other relevant professional method suitable for showcasing the current progress

SLIDE 4 - STAKEHOLDER ENGAGEMENT STRATEGY

Explain who the key stakeholders are, how they have been or will be engaged, and why they matter to the research.

SLIDE 5 - INITIAL INSIGHTS

Briefly summarise the most important things you have found to date.

SLIDE 6 - WHAT NEXT

Outline the next steps in the research process. What still needs to be done, and how the student plans to proceed.
